

# Advocating for the Next Generation of Immune Defense

## Monoclonal antibodies (mAbs) can transform how we protect ourselves from viral illness

The Antibody Innovation Alliance brings together advocates and health professionals to deepen education, awareness, and advocacy of mAbs as safe, proven options to help treat and prevent serious infectious diseases. As viruses like COVID and RSV continue to evolve and vaccine protection can wane, families and individuals need reliable protection that meets the unique needs of each person.

### The Promise of Monoclonal Antibody Innovation

#### Prevent

mAbs are synthetic defense proteins designed to mimic the immune system's natural ability to fight harmful pathogens and diseases.

#### Treat

mAbs have treated cancer and autoimmune diseases for over 50 years; recent advances have the potential to transform prevention and treatment of infectious viral diseases.

#### Protect

Access to mAbs is vital for those needing immediate protection or who can't receive certain vaccines, such as immunocompromised and seniors.

## Expanding Access to mAbs

mAbs add another layer of protection alongside vaccines and antivirals. AIA is advocating for policies and updated regulatory pathways that give clinicians more tools to prevent disease.
